## ZytoDot ${ }^{\circledR}$ 2C SPEC ROS1 Break Apart Probe

## Background

The ZytoDot ${ }^{\circledR}$ 2C SPEC ROS 1 Break Apart Probe PD43) is intended to be used for the qualitative detection of translocations involving the human ROS1 gene at $6 q 22.1$ in formalin-fixed, paraffin-embedded specimens by chromogenic in situ hybridization (CISH). The probe is intended to be used in combination with the $\mathrm{ZytoDot}{ }^{\oplus}$ 2C CISH Implementation Kit (Prod. No. C-3044-10/-40).
The product is intended for professional use only. All tests using the product should be performed in a certified, licensed anatomic pathology laboratory under the supervision of a pathologist/human geneticist by qualified personnel. The probe is intended to be used as an aid to the differential diagnosis of various cancers and therapeutic measures should not be initiated based on the test result alone.

## Probe Description

The ZytoDot ${ }^{\circledR}$ 2C SPEC ROS 1 Break Apart Probe is composed of: - Digoxigenin-labeled polynucleotides ( $\sim 0.50 \mathrm{ng} / \mu \mathrm{l}$ ), which target sequences mapping in $6 q 22.1^{* *}$ (chr6: $117,448,964-117,627,255$ ) proximal to the ROS 1 breakpoint region. Dinitrophenyl-labeled polynucleotides ( $\sim 0.75 \mathrm{ng} / \mu \mathrm{l}$ ), which target sequences mapping in $6 q 22.1^{* *}$ (chr6:117,659,135-117,871,701) distal to the ROS 1 breakpoint region. Formamide based hybridization buffer

Ideogram of chromosome 6 indicating the hybridization locations.

## Results

In an interphase nucleus of a normal cell lacking an aberration involving the $6 q 22.1$ band, using the ZytoDot ${ }^{\oplus}$ 2C CISH Implementation Kit, two red/green fusion signals are expected representing two normal (non-rearranged) 6q22.1 loci. A signal pattern consisting of one red/ green fusion signal, one red signal, and a separate green signal indicates one normal $6 q 22.1$ locus and one $6 q 22.1$ locus affected by a translocation. Isolated green signals are the result of deletions distal to the ROS 1 breakpoint region or are due to unbalanced translocations affecting this chromosomal region.

Example of an aberrant signal pattern: Lung cancer tissue section with rearrangement of the ROS 1 gene as indicated by isolated green signals.
