

VisionArray® HPV High Risk Chip 1.0

Introduction

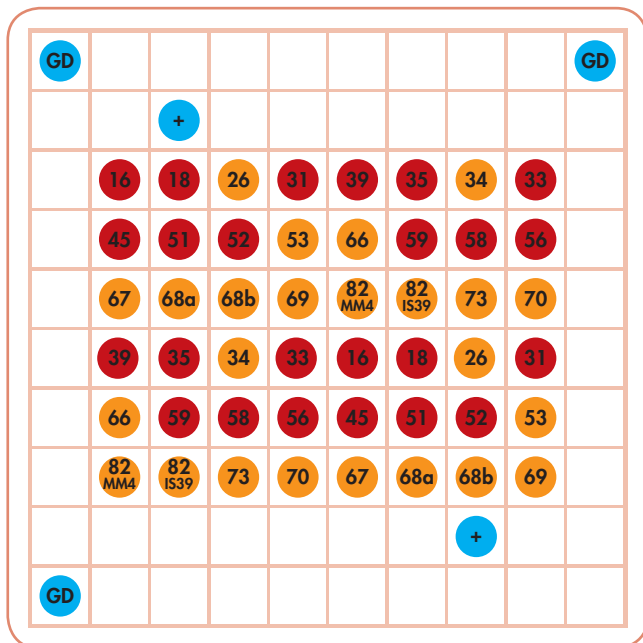

The VisionArray® HPV High Risk Chip 1.0 is intended to be used for the qualitative detection and genotyping of PCR amplicates of 24 clinically relevant human papillomavirus (HPV) genotypes that have been produced with the help of the VisionArray HPV Primer Kit 2.0 and the VisionArray Detection Kit.

HPV has been conclusively identified as the major risk factor for cervical cancer. It is the third most common cancer in women worldwide, with an estimated number of 530,000 new cases and 280,000 deaths each year. Over the last years, the relevance of HPV in the history of oropharyngeal cancers has become more and more important which is indicated by a dramatically risen number of cancers of the oral cavity and pharynx linked to HPV.

At present, there are more than 150 different HPV types described. Several HPV types were classified as High Risk and Probably High Risk types based on their association with cervical cancer.

Chip Description

The VisionArray® HPV High Risk Chip 1.0 is designed to detect 24 clinically relevant HPV genotypes. All capture sequences and the positive control are set up on the Chip as duplicates and the guide dots as triplicates. The signals are visible on the Chip as dark blue areas. The automated evaluation of the results is performed by a VisionArray® Analyzer Software.
